* NOTE: This is a 'working draft' sequence. It currently
* consists of 7 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submittor.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.

* 14335: contig of 14235 bp in length
* 14336 40527: contig of uknown length

consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                    * NOTE: This is a 'working draft' sequence. A cDNA clone (AAT66241) codes for the 55 kDa violaxanthin de-epoxidase (VDE) (AAM09874) of romaine lettuce. VDE was purified from romaine lettuce chloroplasts and 2 tryptic peptides were used to develop primers (see also AAT662445), which amplified a partial VDE sequence. The amplified sequence was then used to screen a lettuce cDNA library, and the 1981 bp DNA sequence was identified. VDE nucleic acids (see also AAT6624-43), in sense or antisense orientation, can be used in genetic constructs, pref. also contg. a plastid translocation sequence, to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underexpression of VDE increases photosynthetic
                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding plant violaxanthin de-epoxidase - used to modify the sensitivity of a plant to light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 95.6%; Score 1894.6; DB 18; Length 1981; Best Local Similarity 97.4%; Pred. (VDE) (AAW09875), an enzyme that catalyses the de-poxidation of violaxanthin to zeaxanthin and antheraxanthin. VDE nucleic acids (see also AAT66241, AAT66243), in sense or antisense orientation, can be used in genetic constructs, pref. also contg. a plastid translocation sequence, to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underexpression of VDE increases photosynthetic efficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be modified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                963 tcaacttcatgagtttcatatggaaaatgataaacttgttgggaacttaacatggcgcat 1022

VDE nucleic acids (see also AAT66241-42), in sense or antisense orientation, can be used in genetic constructs, pref. also contentation, can be used in genetic constructs, pref. also contentation action sequence, to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underexpression of VDE increases photosynthetic
                                                                                                                                                                                                                                                                                                                                                   DNA encoding plant violaxanthin de-epoxidase - used to modify the sensitivity of a plant to light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             efficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be modified.

                                    The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                              acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1921 totttaaaaacatgtatttttataaatgatgagttattttcaatttttggctaaaaaaa 1980
                                                                                                                               present invention relates to a composition comprising two nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    16

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1691 atatggattatgtagatactagagaaaacccaaaaaacttttgtatacgtgataaacgt 1750

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                     The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
